

LIGN210 - Phonetics

Spring Quarter 2009

Class meetings: Monday-Wednesday 12:00-1:50, AP&M 4301.

Instructor: Amalia Arvaniti; office: 4151 AP&M; tel. 53-48409, e-mail: amalia@ling.ucsd.edu

Office hours: Wednesday 2:30-4:30, or by appointment

Course aims and organization: This course is a graduate-level hands-on introduction to phonetics. It covers the four main areas of phonetics, transcription, articulation, acoustics, and speech perception, and includes prosody and experimental design. The aims of the class are the following:

- (a) to teach you the basics of phonetics
- (b) to familiarize you with phonetic research and the current topics of interest/controversy
- (c) to familiarize you and give you some experience with phonetic research protocols.

The final goal is for you to be able to (a) critically assess phonetic and phonetically-based work, and (b) have a basis for designing phonetic (or phonetically-based) research of your own. We will review the basics of each topic in lectures; in addition, many topics are accompanied by readings that present new or controversial perspectives; these will be used for student discussion in class. Emphasis in this course is placed on linguistic phonetics and the connection and relevance of phonetics and phonetic theory to the rest of linguistics, particularly phonology.

Required textbook and additional readings

- Reetz, Henning & Allard Jongman. 2009. *Phonetics*. Wiley-Blackwell.

Other basic reference books

- Johnson, Keith (2003) *Acoustic & Auditory Phonetics*. Oxford: Blackwell
- Ladefoged, Peter (2005) *A Course in Phonetics* (5th edition). Tompson, Wadsworth.
- Ashby, Michael and John Maidment (2005) *Introducing Phonetic Science*. Cambridge University Press.
- Ladefoged, Peter (1996) *Elements of Acoustic Phonetics*. Chicago: The University of Chicago Press
- Borden, Gloria, Katherine Harris and Lawrence Raphael (2003) *Speech Science Primer*. Lippincot, Williams & Wilkins.
- Ladefoged, Peter (2003) *Phonetic Data Analysis*. Blackwell.

Requirements and grading

- This course involves a great deal of new terms that you need to memorize and plenty of reading. You are advised to study and review regularly, as each class builds on terms and notions covered in previous classes.
- Assigned readings are meant to be (at least) skimmed *before* class.
- Late assignments will incur a grade penalty (unless there is a *very good* reason for being late).

Assessment will be based on four things:

- (1) Short essay
- (2) Your participation in class discussions
- (3) Your literature review and project proposal
- (4) Your class paper: topics for these mini research projects are provided. Each is a joint project involving two or three students. You are encouraged to start reading relevant literature as soon as possible, consulting (but not being limited to) the following journals: *Journal of Phonetics*, *Phonetica*, *The Journal of the Acoustical Society of America* (JASA - Speech Communication section), *Speech Communication*, *Language and Speech*, *Phonology*, (*Papers in*) *Laboratory Phonology* series, volumes 1-9, Cognition.

Grades: the grades will be based on the following

Essay	20%
Discussion participation	20%
Literature review & proposal	20%
Class paper	40%
TOTAL	100%

Collaboration, acknowledgements and plagiarism: you are strongly encouraged to work in groups for all assignments, and to discuss your class project not only with your partner(s) but with other students as well. However, all assignments should be your own work. Any help or contribution from others should be acknowledged in a special acknowledgments section of your work (such contribution could be an idea that changed the course of your research paper, help with data collection or analysis, etc.). Please also note that any time you use the ideas or words of someone else you should explicitly acknowledge the source in a citation and in the references. This includes material you found on the web (in which case, you can provide the website in the references).

Lab meetings: We will be holding weekly meetings, to discuss relevant literature and class projects (e.g. how to collect data, how to analyze data statistically, how to write up the project etc). The aim of these meetings is to provide an open forum to exchange views on research and to familiarize you with a collaborative research environment.

Additional resources

- If you are interested in transcription, you can find many websites, including that of the late Peter Ladefoged that offer examples and practice. Anyone of them will do. Spectrogram-reading sites are also available.

LIGN210 Phonetics

Instructor: Amalia Arvaniti

Spring Quarter 2009

Week	Monday	Wednesday	Reading	Assignments
Wk 1	3/30: Aims and structure of the course. What is phonetics and why it is worth studying it? Relationship with phonology	4/1: Basic articulatory phonetics and transcription of GAE	R&J, chapter 1 Ladd (in press) Port (ms) ----- R&J chapters 2 &3	
Wk 2	4/6: Bob Port's visit; discussion of his and Bob Ladd's paper	4/8: More on the articulation of consonants and vowels	R&J, chapter 1 Ladd (in press) Port (ms) ----- R&J, chapter 4	
Wk 3	4/13: Double articulation, vowels, airstream mechanisms	4/15: Physiology	R&J, chapters 4 and 6 ----- R&J, chapter 5	
Wk 4	4/20: Amalia at USC – no class	4/22: Coarticulation and theories of articulation Basics of experimental design (in lab meetings)	4/22 Goldstein & Fowler 2003 Nolan 1992 ----- AA's notes – lab meetings	
Wk 5	4/27: Introduction to acoustics	4/29: Principles of digital signal processing	R&J, chapter 7 ----- R&J, chapter 8	4/27: Short essay/commentary (2-3 pages) on Port, Ladd and coarticulation

Wk 6	5/4: The source-filter theory of speech production	5/6: Acoustic characteristics of speech sounds	R&J, chapter 9 ----- R&J, chapter 10	5/4: Literature review and project proposal due 5/6: Record one short audio file for spectrogram reading in class (we should not know their content)
Wk 7	5/11: Prosody I: stress and rhythm	5/13: Prosody II: tone, pitch accent, intonation	R&J, Chapter 11 (11.1-11.3) Beckman & Edwards 1994 Cummins & Port 1998 Arvaniti 2009 ----- R&J, Chapter 11 (11.4) Arvaniti 2007 OR Arvaniti & Ladd 2009 Gooden et al. In press Zsiga & Nittisaroj 2007	
Wk 8	5/18: Hearing	5/20 Speech perception I	R&J, Chapter 12 ----- R&J, Chapter 13 Lotto, Hickok, Holt 2009	
Wk 9	5/25 Memorial Day NO CLASS	5/27: Speech perception II	Hawkins, 2003 Johnson 2006 Xu et al. 2006	
Wk 10	6/1: Perception and acquisition	6/3: Project presentations	Narayan 2008 Li, Edwards & Beckman 2009	6/3: Class presentation of project
Exam week				6/11: class papers due

PROJECTS: the project descriptions are indicative only; you can change the languages used or the focus of the project to better suit your interests (subject to instructor approval)

1. A classic view of linguistic rhythm is that languages fall into two main categories, syllable-timed languages (like French) and stress-timed languages (like English), with many languages being somewhere in between. Empirical evidence for these categories has been elusive, but recently groups of researchers have argued that they have found measures allowing for the successful classification of languages along the stress- vs. syllable-timing continuum. However, most researchers look at well-known languages that are relatively easy to classify, such as Spanish, Dutch, Catalan etc. In this project you will record at least two of the following languages, English, German, Spanish, Italian, Greek, Korean, and examine the effect of speaking rate on metric scores.

Or have two groups work on that?

2. One of the paradigms used for the examination of speech rhythm is that of entrainment, where speakers are asked to adapt the rhythm of their utterances to the beats of a metronome (beating at different rhythms). Work by Fred Cummins has shown that entrainment is easier for English speakers than Spanish and Italian speakers, which he interprets as evidence for different rhythmic categories. However, the phrases he used are not comparable across languages: cf. *big for a duck* vs. *busca la moto*. Thus, the difference between these languages may be found in the materials used, some of which allow for easier "pedification" (foot-formation). In this experiment, we will test this hypothesis with materials from Spanish and Korean (in which the foot is not so important).

A cycling experiment as well.

3. Record data from two languages (it does not matter how related they are); the data should be recorded at fast and normal speaking rate; compare the rates of reduction for vowels and consonants in these languages. What does that tell us about speaking rate and its linguistic effects? Are they the same for both languages, or are there any differences. If so, what do they tell us about timing and the organization of speech production?
4. how about an experiment of how others perceive the tonal contrasts of a language or assign stress and accent and so on – like Ken's work

something about tone perception???? And/or production for Jing and Bethany

5. One of the standing problems of English intonation has been the role of the "phrase accent," a tonal category that is said to fill the gap between the last stress-related pitch movement of an

utterance (nucleus) and the end of the overall melody. It is possible that this "phrase accent" is attracted to stress, so, for example, when pitch falls it is timed so as to be flat on the first stressed syllable after the nucleus; this hypothesis can be tested by using utterances with falling intonation that end in single words with stress in various syllables (tried and tested: Ma, Mama, Mamalie), compounds and words with secondary stress (e.g. boysenberry, Abernathy) and utterances with early focus.

6. Phrase accents attracted to stressed syllables are also said to be part of calling contours in English. On the other hand, it is not clear how such contours operate in other languages, particularly languages like Spanish which do not have multiple stresses in the same word. In this study, you would do a comparative analysis between English and Spanish calling contours, to see what differences there exist between the two languages (since they have different metrical systems), and the extent to which the existing analyses of English are correct.
7. Clopper, Pisoni and de Jong (2005) provide new data that show different vowel systems for different regions in the US; this classification has one large region, "the West" which includes everything west of the Rockies; record native Californian speakers from different areas of California and compare their data to the Clopper et al. data from "the West." Are the data you collect the same as those of Clopper et al., and if not, what are the differences and what do you think they can be attributed to?
